

# Designer-Ready Website Content Master

Page-by-page launch copy, URL strategy, SEO migration notes and proof references

Prepared for Neologicx Resources Pvt Ltd

6 August 2026 • Designer / Developer Handoff

Source base: Neologicx Enterprise Solutions Portfolio • prior Global Market Website Audit • Google Search Console 3-month export • verified live-page references

## How to Use This Content Master

This is a build document, not another audit. The text under each website-page heading is proposed launch copy. The implementation footer at the end of every website page is for the designer, developer and SEO team only; it must not appear on the public website.

1. Copy can be designed, broken into cards or shortened responsively, but its meaning and evidence boundaries should be preserved.
2. Where a claim is marked for confirmation, the team should verify it before launch rather than replacing it with generic marketing language.
3. Existing URLs are intentionally retained wherever practical. A technology change to Next.js does not require a URL change.
4. Case studies avoid invented performance metrics. Add results only when a client or internal record can substantiate them.
5. Use US English consistently across the new site.

## Recommended Global Navigation

Services • Solutions • Industries • Case Studies • Insights • About • Contact | Primary CTA: Discuss Your Project

## Services mega-menu

6. Product Engineering → SaaS Development, MVP Development
7. Custom Software Development → Custom Business Software & ERP, Custom CRM
8. Web Application Development
9. Mobile App Development
10. E-commerce Engineering → WordPress & WooCommerce where relevant
11. API, Integration & Automation → WhatsApp Business Platform Integration

## Site-wide Public Footer Copy

Neologicx Resources Pvt Ltd  
 Custom Software & Product Engineering • Established 2000  
 Bikaner, Rajasthan, India

Services • Solutions • Case Studies • Insights • About • Contact  
 Privacy Policy • Terms • Cookie Policy

Contact email/phone and social links should be added only after the team confirms the public sales mailbox, current numbers and LinkedIn URL.

## Technology Display — Confirm Before Publishing

The earlier audit recommended replacing vague ‘cutting-edge technology’ language with a specific, honest stack. The following is the working list to validate with engineering before the designer turns it into a logo wall:

|                             |                                                                       |
|-----------------------------|-----------------------------------------------------------------------|
| <b>Frontend</b>             | React, Next.js, Angular, TypeScript                                   |
| <b>Mobile</b>               | Flutter, Android, iOS                                                 |
| <b>Backend</b>              | Node.js / NestJS, PHP / Laravel                                       |
| <b>CMS &amp; Commerce</b>   | WordPress, WooCommerce, Magento Open Source / Adobe Commerce, Shopify |
| <b>Data</b>                 | PostgreSQL, MySQL, MongoDB, Firebase                                  |
| <b>Cloud &amp; Delivery</b> | AWS, Azure, DigitalOcean, Docker, CI/CD                               |

Do not publish a technology simply because it appears here; engineering must confirm active delivery capability and ownership depth.

## Next.js Rebuild — SEO Rules That Protect Existing Google Equity

Moving from the current technology to Next.js is a reasonable rebuild choice if the team can maintain it. The framework change itself is not the primary SEO risk. The migration risk comes from changing URLs, removing useful content, returning the wrong status codes, blocking crawlers, weakening internal links or shipping pages that Google cannot reliably render/index.

### Non-negotiable migration rules

12. Retained pages must resolve at the same public URL wherever practical, including trailing-slash behavior and HTTPS canonicalization.
13. Merged pages need one-hop permanent 301 redirects to the closest materially equivalent successor. Do not mass-redirect unrelated retired pages to Home.
14. If a page is genuinely discontinued and has no equivalent successor, use a real 404/410 rather than a soft 404 or misleading redirect.
15. Core page copy and metadata should be present in server-rendered/pre-rendered HTML; do not make critical content depend on client-only execution.
16. Carry over or improve title tags, meta descriptions, canonical tags, heading structure, image alt text, breadcrumbs and meaningful internal links.
17. Generate an accurate XML sitemap containing only canonical, indexable URLs; keep robots.txt and page-level robots directives intentional.
18. Preserve the indexed portfolio PDF at /Neologicx\_Enterprise\_Solutions\_Portfolio.pdf unless a deliberate replacement plan is tested.
19. Implement Organization/LocalBusiness details consistently (Neologicx Resources Pvt Ltd; Bikaner, Rajasthan, India) and Breadcrumb structured data where appropriate.
20. Preserve analytics and Search Console verification. Annotate launch date and compare coverage, clicks, impressions and top landing pages after release.
21. Crawl staging and production before DNS/launch sign-off: no redirect chains, accidental noindex, broken canonicals, orphan pages, mixed protocols or 404 assets on key templates.

### What Search Console says to protect

|                   |                                                                                   |
|-------------------|-----------------------------------------------------------------------------------|
| <b>Whole site</b> | 129 clicks • 7,608 impressions in the supplied last-3-month export.               |
| <b>Home</b>       | 108 clicks • 2,215 impressions — 83.7% of all clicks. Highest migration priority. |
| <b>/about-us/</b> | 1,408 impressions. Preserve path and entity/history signals.                      |

|                                     |                                                                                                                                                                      |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/home/contact/</b>               | 6 clicks • 251 impressions. 301 directly to /contact/.                                                                                                               |
| <b>/portfolio/e-parchi-android/</b> | 3 clicks • 278 impressions • avg position 5.43. Preserve 1:1.                                                                                                        |
| <b>/portfolio/rajuvas/</b>          | 1 click • 72 impressions • avg position 3.74. Preserve 1:1.                                                                                                          |
| <b>Local entity signal</b>          | ‘it companies in bikaner’ — 8 clicks / 156 impressions; keep Bikaner/India identity in About, footer and structured data.                                            |
| <b>International reality</b>        | India produced 122 of 129 clicks. The content rebuild should improve global relevance, but overseas impressions should not be treated as proof of qualified traffic. |

## Launch monitoring

22. Day 0–2: submit sitemap, inspect Home and priority service/case-study URLs, verify redirects and indexing directives.
23. Week 1–2: watch crawl/index coverage and any sharp drop in impressions for preserved URLs.
24. Week 3–6: compare page/query patterns, fix unexpected 404s/canonicalization issues, and strengthen internal linking where new cluster pages are not being discovered.
25. Week 6–12: evaluate qualified international impressions/clicks and lead quality before adding country-specific landing pages.

## Final Website Page Inventory

The pages below have complete launch-copy briefs in this document. 'Conditional' means the copy is prepared, but the page should not go live until the stated evidence/support check is complete.

| #  | Website page                           | Final URL                                                                                                                                         |
|----|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  | Home                                   | <a href="https://neologicx.com/">https://neologicx.com/</a>                                                                                       |
| 2  | About                                  | <a href="https://neologicx.com/about-us/">https://neologicx.com/about-us/</a>                                                                     |

## Custom Software & Product Engineering for Growing Businesses

We design, build and modernize web platforms, mobile applications, SaaS products and business software for startups, SMEs and institutions—backed by more than 25 years of delivery experience.

[Discuss Your Project](#) • [View Case Studies](#)

### Build software around the way your business actually works

Off-the-shelf tools are useful until your workflows, integrations or growth plans stop fitting the template. Neologicx helps teams turn those operational gaps into practical digital products—from the first discovery conversation through design, engineering, deployment and ongoing improvement.

### What we build

#### Product Engineering

MVPs, SaaS products and digital platforms built around a clear product roadmap, usable interfaces and an architecture that can evolve.

#### Custom Business Software

ERP-style systems, CRM workflows, operations platforms, dashboards and portals tailored to the processes your team needs to run.

#### Web Applications

Responsive web platforms, customer portals, content-rich institutional websites and workflow applications connected to your existing systems.

#### Mobile Applications

iOS, Android and Flutter applications for customer experiences, field teams, communities and operational workflows.

#### E-commerce Engineering

Storefronts and commerce workflows across Magento Open Source / Adobe Commerce, WooCommerce, Shopify and custom platforms.

## Integration & Automation

APIs, payment and third-party integrations, WhatsApp Business Platform workflows and automation that reduce disconnected manual work.

## Experience grounded in real operations

Our portfolio spans education and public institutions, FMCG and manufacturing, retail and e-commerce, construction, hospitality, events and professional services. The common thread is operational complexity: multiple users, approvals, data, transactions and systems that need to work together.

26. BIKAJI — e-commerce, mobile commerce and a structured customer-care portal with complaint tracking and WhatsApp notifications.
27. Public universities — content-driven web platforms and administration-focused systems for institutions including RAJUVAS and SKRAU.
28. The Jazz Café, Reading, UK — restaurant and event management workflows covering bookings, payments and event operations.
29. ECK-RTU Alumni Connect — alumni discovery, events, donations and notifications across Android and iOS.

## A delivery process designed for clarity

1. Discover — align on the business problem, users, workflows, constraints and success criteria.
2. Define — turn requirements into scope, priorities, architecture and a realistic delivery plan.
3. Design — map user journeys, wireframes and interfaces before expensive rework reaches engineering.
4. Build — develop in reviewable increments with source control, peer review and documented decisions.
5. Validate — test critical flows, integrations, devices and release candidates against agreed acceptance criteria.
6. Launch & improve — deploy, monitor, support and evolve the product as real usage creates new priorities.

## Working with teams beyond our time zone

A good offshore relationship depends on visibility, not proximity. We structure projects around agreed milestones, documented decisions, shared project communication and planned overlap for the conversations that matter. Engagements can be shaped around a defined scope, an ongoing product team or time-and-materials delivery.

Have a product, platform or process that needs better software?

Tell us what you are trying to improve. We will help you identify the right starting point and a practical path to delivery.

Section CTA: Discuss Your Project

DESIGNER NOTE

Confident, technical and spacious. One hero message; no rotating service carousel. Use real product/workflow screens rather than generic stock-code imagery.

Implementation footer — not website-visible

## 25+ Years of Building Software Around Real Operations

Neologicx Resources Pvt Ltd is a software engineering company established in 2000 in Bikaner, Rajasthan, India. We build digital products and business systems for organizations that need technology to fit the way they actually operate.

[Explore Our Work](#) • [Discuss Your Project](#)

### From websites to connected business platforms

Our work has evolved with the web itself: from content-driven websites and early business applications to mobile products, e-commerce, ERP-style platforms, APIs, automation and SaaS. What has stayed consistent is our focus on solving a concrete business problem before choosing the technology.

### Where our experience comes from

Over the years we have worked across public institutions and education, FMCG and manufacturing, retail and e-commerce, construction, hospitality and events, professional services and workforce-focused platforms. That breadth helps us recognize the operational patterns that repeat across industries—approvals, roles, transactions, reporting, communication and integrations—while still respecting the details that make each business different.

### Local roots. Global working mindset.

Our delivery base is in Bikaner, India, and our portfolio includes work for organizations in India as well as international engagements such as The Jazz Café in Reading, UK and an event marketplace spanning India and Singapore. For remote engagements, we emphasize clear ownership, documented scope, planned communication and practical time-zone overlap.

### How we approach a project

#### Understand before prescribing

We start with users, workflows, constraints and outcomes instead of forcing every problem into the same product template.

#### Make complexity visible

Flows, roles, data and integrations are mapped early so technical decisions have business context.

### Deliver in reviewable increments

Regular demonstrations and acceptance points make progress easier to evaluate and reduce late surprises.

### Build for handover and continuity

Documentation, source ownership, access and post-launch support should be agreed as part of the engagement—not discovered at the end.

### Proof should be specific

Our new website deliberately avoids claims such as “best,” “top-tier,” “bug-free” or “100% secure.” Instead, explore the case studies to see the business context, workflows and solution scope behind selected projects.

**Section CTA: View Case Studies**

#### DESIGNER NOTE

Use a restrained timeline, real team/work imagery and a proof strip. Keep Bikaner/India visible for entity/local SEO without making the page feel locally limited.

### Implementation footer — not website-visible

## Software Engineering Services from Discovery to Support

Whether you are validating a new product, replacing a legacy workflow or connecting systems that no longer work well together, we can take responsibility for the path from discovery and UX through engineering, release and ongoing improvement.

[Discuss Your Project](#) • [View Case Studies](#)

### Core capabilities

#### Product Engineering

Discovery, MVP development, SaaS engineering, product modernization and ongoing product enhancement.

#### Custom Software Development

Business applications, ERP-style platforms, CRM workflows, operational dashboards, portals and workflow automation.

#### Web Application Development

Customer-facing platforms, enterprise portals, institutional websites, content platforms and responsive web applications.

#### Mobile App Development

iOS, Android and Flutter applications for customers, communities, field teams and business operations.

#### E-commerce Engineering

Commerce platforms, catalogs, checkout, payments, order and inventory integrations, and platform modernization.

#### API, Integration & Automation

APIs, webhooks, third-party systems, payments, WhatsApp Business Platform workflows and data synchronization.

### Specialist services

7. SaaS product development and modernization
8. MVP development for startups and new initiatives
9. Custom CRM and sales workflow automation

10. Custom business software and ERP development
11. WhatsApp Business Platform integration and automation
12. WordPress and WooCommerce development for content and commerce use cases

### How an engagement moves

1. Discovery and requirements — users, workflows, priorities, constraints and success criteria.
2. UX and solution definition — journeys, interfaces, data, integrations and technical approach.
3. Incremental engineering — reviewable builds, demos and transparent issue tracking.
4. Quality engineering — functional, integration, device/browser and release validation matched to project risk.
5. Deployment and support — release planning, production handover, monitoring and agreed maintenance.

### Start with the problem, not the service label

If your requirement crosses several categories, that is normal. Share the business goal and current constraints; we will help shape the right combination of product, software, integration and support work.

#### Section CTA: Tell Us What You Need

#### DESIGNER NOTE

Use six primary capability cards, then a smaller ‘specialist services’ row. Do not present every technology as an equal top-level service.

## Implementation footer — not website-visible

| <b>Sources / evidence</b>  | Prior audit service architecture; portfolio PDF pp. 5–39; current Services page; Search Console export 6 Aug 2026.                                                                         |
| <b>Publish checks</b>      | Remove Digital Marketing and Game Development from primary global navigation. Remove the “bug-free” QA claim. Confirm actual technologies before displaying stack logos.                   |

## Configurable Software Solutions Built Around Real Workflows

Some business problems do not need to start from a blank page. Neologicx has developed reusable foundations for recurring operational needs that can be configured around your users, approvals, reporting and integrations.

[Request a Walkthrough](#) • [Discuss a Custom Requirement](#)

### Launch solutions

#### Construction Operations

Coordinate multiple sites, material movement, workforce records, petty expenses and vendor payments from a shared operational view.

#### Complaint Management

Capture customer issues, categorize and prioritize complaints, track resolution and keep customers informed through structured notifications.

#### Distributor–Retailer Order Management

Centralize order intake, inventory visibility, fulfillment status, shipping/returns workflows and connected reporting.

#### School Management — conditional

Admissions, attendance, academic records, fees, communications and parent/teacher workflows. Publish only after confirming that this remains an actively supported solution.

### Configuration, not a one-size-fits-all promise

A solution foundation can shorten discovery and development, but your roles, approvals, integrations, reports and deployment environment still matter. We begin with a fit assessment, identify what can be reused, and make the customization boundary explicit before implementation.

### Need something more specific?

Our custom software team also builds ERP-style operations platforms, CRM workflows, portals and industry-specific systems when a configurable foundation is not the right fit.

**Section CTA: Explore Custom Software Development**

## DESIGNER NOTE

Position these as proven configurable foundations—not app clones. Each card should show target user, workflow scope and a 'Request a walkthrough' CTA.

| <b>SEO title</b>           | Configurable Business Software Solutions   Neologicx                                                                                                                                                     |
| <b>Meta description</b>    | Explore configurable software foundations for construction operations, complaint management, order workflows and education administration.                                                               |
| <b>Sources / evidence</b>  | Portfolio PDF pp. 5–15, 19, 39; current Products pages; prior audit; Search Console export 6 Aug 2026.                                                                                                   |
| <b>Publish checks</b>      | Do not describe every solution as 'ready-to-use' unless it can actually be demonstrated, licensed, supported and deployed today. School solution is conditional pending commercial/support confirmation. |

## Software Built for Real-World Workflows

Selected projects from more than two decades of software delivery—shown through the business problem, the workflow we helped digitize and the solution that was delivered.

[Discuss a Similar Project](#) • [Explore Services](#)

### Featured work

#### BIKAJI — Customer Care & Commerce

E-commerce and customer-care workflows, including structured complaint handling, severity tracking, an administration dashboard and WhatsApp notifications.

#### ECK-RTU — Alumni Connect

Android and iOS alumni experience covering registration, discovery by batch/city/industry, events, donations and push notifications.

#### Election Commission of India — Mobile Service Platform

A public-facing mobile application bringing election information and citizen-facing utilities into a consolidated experience.

#### RAJUVAS & SKRAU — University Web Platforms

Content-rich, responsive public university websites and CMS/backend workflows designed for complex institutional information.

#### The Jazz Café, UK — Restaurant & Event Operations

A web-based system supporting bookings, events, payments, reminders and back-office coordination.

#### Heritage Olympiad — Culture & Learning

A mobile learning and quiz experience focused on tangible, intangible and natural heritage, with competitive play and leaderboards.

### More work worth preserving

The rebuilt site should also preserve the indexed portfolio URLs for E- Parchi, WUS App, university work and other legitimate projects even when they are not featured in the primary grid. Historical URLs can continue to carry search value and deepen credibility when their content is accurate.

## Have a similar workflow?

Use these examples as a starting point—not a promise that your project will look the same. Tell us your users, constraints and systems, and we will map the right approach for your context.

### Section CTA: Discuss Your Project

#### DESIGNER NOTE

Use filterable proof cards by capability/industry, not a wall of screenshots. Each card should show client/context, problem, solution scope and one concrete delivered workflow.

### Implementation footer — not website-visible

| <b>Meta description</b>    | See selected Neologicx work across mobile apps, web platforms, business systems, e-commerce, education, government and international projects.                                                                                                                                                                                                                                                             |
| <b>Sources / evidence</b>  | Portfolio PDF pp. 6–39; live portfolio entries; prior audit; Search Console export 6 Aug 2026.                                                                                                                                                                                                                                                                                                             |
| <b>Publish checks</b>      | Before publishing named client stories, confirm logo/name permission and current factual accuracy. Never invent metrics. Add quantified outcomes only when a client or internal record can substantiate them.                                                                                                                                                                                              |

## Software Experience Across Operationally Complex Industries

Industry knowledge matters most when it helps a team ask better questions. Our experience spans environments where roles, approvals, transactions, reporting and communication need to work reliably across many stakeholders.

[View Case Studies](#) • [Discuss Your Industry](#)

### Where we have worked

#### Education & Public Institutions

University websites and portals, institute operations, school administration, recruitment workflows, examinations, learning and alumni engagement.

#### FMCG & Manufacturing

Customer-care workflows, inventory, billing, production visibility, procurement and operational systems for manufacturing environments.

#### Retail & E-commerce

Commerce platforms, catalogs, payments, orders, inventory and customer-service integrations for brands and retailers.

#### Construction & Field Operations

Multi-site workflows covering supervisors, materials, workforce records, petty expenses and vendor payments.

#### Hospitality & Events

Restaurant/event booking and management, event marketplaces, online payments, reminders and stakeholder dashboards.

#### Professional & Member Organizations

Legal case management, clubs, associations, business directories and member/community platforms.

### Your domain will still be different

We use prior experience to accelerate discovery, not to assume your process. Every engagement begins by mapping the roles, rules, exceptions, data and integrations that are specific to your organization.

## Section CTA: Talk Through Your Workflow

### DESIGNER NOTE

Use six industry panels with one real project example per panel. Link to case studies and relevant service pages.

| <b>Meta description</b>    | Neologicx software experience across education, manufacturing, FMCG, retail, construction, hospitality, events and professional workflows.              |
| <b>Sources / evidence</b>  | Portfolio PDF pp. 3–39; prior audit industry recommendation.                                                                                            |
| <b>Publish checks</b>      | Only include industries backed by real work. Keep healthcare wording to workflow/support software unless clinical claims have been separately reviewed. |

## A Delivery Model That Fits the Work

A well-structured software engagement makes ownership, priorities, communication and cost easier to manage. We can shape the working model around the maturity of your scope and the continuity your product needs.

[Discuss the Right Model](#) • [View Our Process](#)

### Ways to engage

#### Defined Scope

Best when requirements and acceptance criteria are sufficiently clear. Scope, milestones, assumptions and change control are agreed before delivery begins.

#### Dedicated Product Team

Best for products with an ongoing roadmap. A stable team works through prioritized outcomes over successive delivery cycles.

#### Time & Materials

Best when requirements will evolve or discovery is part of the work. Priorities can change while effort and progress remain visible.

#### Support & Modernization

Best for an existing application that needs maintenance, upgrades, integrations, performance work or a staged modernization plan.

### What should be clear before kickoff

6. Scope, assumptions, exclusions and acceptance criteria
7. Team roles and decision owners on both sides
8. Communication rhythm, demonstrations and escalation path
9. Source repository, environments and access ownership
10. Quality, security and release responsibilities appropriate to the project
11. Documentation, IP/code handover and post-launch support expectations

Not sure which model fits?

Start with the uncertainty. If scope is clear, we can discuss a defined delivery plan; if the product is still evolving, a more flexible model is usually more realistic.

Section CTA: Book a Discovery Conversation

DESIGNER NOTE

A comparison layout works well here. Keep legal/commercial detail concise and link to a discovery call rather than publishing unapproved contract terms.

|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Final URL           | https://neologicx.com/engagement-models/                                                                                                                                                      |
| Earlier reference   | New page — no earlier public URL.                                                                                                                                                             |
| Migration / launch  | NEW PAGE. Recommended for international buyers who need to understand commercial and delivery structure before a first call.                                                                  |
| GSC — last 3 months | New page / no matching historical URL in the supplied 3-month export.                                                                                                                         |
| SEO title           | Software Development Engagement Models   Neologicx                                                                                                                                            |
| Meta description    | Choose a fixed-scope, dedicated-team, time-and-materials or ongoing support model for your Neologicx software engagement.                                                                     |
| Sources / evidence  | Prior Global Market Website Audit; global-buyer trust requirements identified in the audit.                                                                                                   |
| Publish checks      | Management/delivery leadership must confirm the exact commercial terms, minimum team sizes, billing cadence, time-zone overlap, SLA language, IP transfer and NDA process before publication. |

## Practical Thinking on Building and Improving Software

Lessons, patterns and decision guides from product delivery, custom software, mobile development, integrations, automation and modernization.

Explore Latest Insights • Discuss a Project

### Editorial categories

#### Product Engineering

Discovery, MVP scope, SaaS architecture, product roadmaps and launch decisions.

#### Custom Software & Modernization

Workflow design, legacy replacement, architecture, data migration and operational systems.

#### Mobile & Web Engineering

Platform choices, UX, performance, release planning and maintainability.

#### Integration & Automation

APIs, messaging, WhatsApp Business Platform workflows, payments and connected business processes.

#### E-commerce

Commerce architecture, platform choices, checkout, operations and system integration.

#### Delivery & Quality

How to scope, govern, test, release and support software with a remote engineering partner.

### Editorial standard

Every article should answer a real buyer or practitioner question, include concrete examples, and link to relevant proof. Avoid articles written only to repeat high-volume keywords without a useful point of view.

#### DESIGNER NOTE

Editorial grid with category filters, author/date/read time, and strong related-service/case-study links. Avoid WordPress archive clutter in the primary UX.

| <b>Migration / launch</b>  | KEEP URL, relabel navigation as Insights. Retain useful existing article URLs; remove/noindex thin archive/tag pages where they add no search or user value.                           |
| <b>GSC — last 3 months</b> | /blog/: 0 clicks • 96 impressions • avg position 37.17                                                                                                                                 |
| <b>SEO title</b>           | Software Engineering Insights   Neologicx                                                                                                                                              |
| <b>Meta description</b>    | Practical perspectives from Neologicx on product engineering, custom software, mobile, integrations, e-commerce and software modernization.                                            |
| <b>Sources / evidence</b>  | Prior audit; Search Console export 6 Aug 2026; current Blog page and indexed article/archive URLs.                                                                                     |
| <b>Publish checks</b>      | Editorial calendar should favor demonstrated engineering/business expertise over generic SEO posts. Preserve any individual article URL that already ranks or earns qualified traffic. |

## Tell Us What You're Building

Share the problem, product or workflow you want to improve. A short description is enough to start—we can work through scope, constraints and the right engagement model together.

[Send Project Brief](#) • [Book a Discovery Call](#)

### Project inquiry form

12. Name
13. Work email
14. Company / website
15. Country and time zone
16. What do you need? — Product engineering / Custom software / Web / Mobile / E-commerce / Integration & automation / Other
17. Briefly describe the problem or project
18. Indicative budget range — optional
19. Expected start window — optional
20. File or brief upload — optional
21. Privacy consent

### What happens next

1. We review the context you share.
2. If there is a reasonable fit, we arrange a discovery conversation with the right technical/business owner.
3. We clarify scope, unknowns, delivery model and the next useful artifact—estimate, discovery plan or proposal.

### Direct contact

Neologicx Resources Pvt Ltd • Bikaner, Rajasthan, India

Email: [rajeev@neologicx.com](mailto:rajeev@neologicx.com) • Phone / WhatsApp: +91 94141 38694 / +91 94141 38620

For international calls, use the scheduling link to choose a mutually workable time.

## DESIGNER NOTE

One short form, one calendar option, visible India location/time zone and a clear expectation of what happens next. Do not show a 14-service checkbox wall.

## Product Engineering for SaaS, MVPs & Digital Platforms

Turn a product idea, an evolving SaaS platform or an aging digital product into a clear roadmap and a maintainable software system. We can support the full journey from discovery and UX through engineering, release and iteration.

[Discuss Your Product](#) • [Explore Case Studies](#)

### Where we can help

#### Product Discovery

Clarify users, workflows, product risks, priorities, assumptions and what must be learned before committing to a large build.

#### MVP Development

Define a focused first release that tests the product's core value without treating 'minimum' as an excuse for fragile engineering.

#### SaaS Engineering

Build role-based platforms, subscription/payment integrations, workflows, reporting and APIs around the product's operating model.

#### Product Modernization

Improve an existing product through staged UX, architecture, performance, integration and maintainability work rather than an automatic big-bang rewrite.

#### Ongoing Product Delivery

Maintain a prioritized roadmap, ship reviewable increments and continue improving the product after launch.

### From idea to production

1. Frame the problem and identify the riskiest assumptions.
2. Map the primary user journeys, roles and business rules.
3. Prioritize the release and define acceptance criteria.
4. Design and build in increments that can be demonstrated and reviewed.
5. Validate critical flows and integrations before release.

6. Use feedback and operating data to shape the next roadmap decisions.

## Built for products with more than one stakeholder

Our portfolio includes platforms for organizers and attendees, institutions and students, alumni communities, authors and editors, and operational teams with role-based responsibilities. Those projects reinforce an important product lesson: the difficult part is often not the screen—it is the interaction between roles, rules, transactions and information.

### Section CTA: Plan Your Product Roadmap

#### DESIGNER NOTE

Use a product lifecycle visual: Discover → Validate → Build → Scale. Feature proof from the event marketplace, alumni platform and conference/paper-submission platform.

#### Implementation footer — not website-visible

|                            |                                                                                                                                             |

| <b>Earlier reference</b>   | New page — no earlier public URL.                                                                                                           |
| <b>Migration / launch</b>  | NEW PRIMARY CAPABILITY PAGE. Make this the parent for SaaS and MVP pages; link both existing URLs as specialist services.                   |
| <b>GSC — last 3 months</b> | New page / no matching historical URL in the supplied 3-month export.                                                                       |
| <b>SEO title</b>           | Product Engineering Services   Neologicx                                                                                                    |
| <b>Meta description</b>    | Product discovery, MVP development, SaaS engineering, modernization and ongoing product delivery from Neologicx.                            |
| <b>Sources / evidence</b>  | Prior audit recommended service architecture; portfolio PDF examples across SaaS-like multi-stakeholder platforms, mobile and web products. |
| <b>Publish checks</b>      | Engineering leadership should approve the architecture/DevOps language and the exact technology stack before publishing technology badges.  |

## Custom Software Development for Complex Business Workflows

When spreadsheets, disconnected tools or generic software create more work than they remove, custom software can bring the workflow, data and decisions into one coherent system.

[Map Your Workflow](#) • [View Business Software Work](#)

### Software shaped around your operations

#### Operations & ERP-style Platforms

Connect processes such as procurement, inventory, production, billing, projects, documents and approvals according to the way your organization runs.

#### CRM & Customer Workflows

Bring leads, accounts, conversations, tasks, service requests, pipeline stages and reporting into a workflow your team can actually adopt.

#### Portals & Role-based Systems

Give staff, customers, vendors, members or partners the right information and actions based on their role.

#### Dashboards & Reporting

Turn operational data into views that help teams monitor status, exceptions and work that needs attention.

#### Integrations & Automation

Connect payments, messaging, email, vendors, logistics and existing applications so people are not re-entering the same information across systems.

### Examples from our portfolio

7. Manufacturing operations — milk collection, inventory, billing and production tracking in a connected web/mobile workflow.
8. Engineering & consultancy — project planning, procurement, documentation, shipping, approvals and cross-department visibility.
9. Legal case management — centralized case records, cause-list workflows, team allocation and mobile updates.

10. Institute operations — inquiries, counseling, tutor availability and matching, scheduling, enrollment, attendance and content workflows.

## Modernize without losing business knowledge

If an existing system already contains years of process knowledge, replacement should be planned carefully. We can map current workflows, dependencies and data, identify what should be retained, and stage the migration around business risk.

### Section CTA: Discuss Your Current System

#### DESIGNER NOTE

Lead with operational workflows and system maps, not laptops/code. Use manufacturing, engineering consultancy, legal and institute-management examples as proof.

#### Implementation footer — not website-visible

|                            |                                                                                                                                                      |

| <b>Earlier reference</b>   | New page — no earlier public URL.                                                                                                                    |
| <b>Migration / launch</b>  | NEW PRIMARY CAPABILITY PAGE. Parent page for Custom Business Software & ERP and Custom CRM. Do not redirect the established ERP/CRM child URLs away. |
| <b>GSC — last 3 months</b> | New page / no matching historical URL in the supplied 3-month export.                                                                                |
| <b>SEO title</b>           | Custom Software Development Services   Neologicx                                                                                                     |
| <b>Meta description</b>    | Custom business applications, workflow systems, ERP-style platforms, CRM, portals, dashboards and automation built around your operations.           |
| <b>Sources / evidence</b>  | Portfolio PDF pp. 5–15; prior audit service architecture.                                                                                            |
| <b>Publish checks</b>      | Do not imply prebuilt modules that do not exist. Describe finance/payroll/security features only where the proposed system actually includes them.   |

## Custom Web Application Development

We build web platforms that do more than publish pages—customer portals, operational systems, dashboards, institutional platforms and digital products designed around users, data and integrations.

[Discuss Your Web Platform](#) • [View Web Case Studies](#)

### What we build

#### Business Web Applications

Role-based applications for internal operations, approvals, reporting and cross-team workflows.

#### Customer & Partner Portals

Secure experiences for customers, vendors, members or partners to access information, transactions and services.

#### Institutional Web Platforms

Structured, content-rich platforms for universities, public institutions and organizations with complex information architecture.

#### Dashboards & Administration

Operational views and admin tools for managing content, users, transactions, exceptions and reporting.

#### Modernization

Incremental redesign, architecture and performance improvements for web applications that have outgrown their original implementation.

### Designed as a system, not a collection of pages

Good web engineering starts with content or data models, user roles, key workflows, integrations, performance needs and the way the application will be operated after launch. The interface should make that underlying system easier to use—not hide complexity behind visual effects.

### Technology approach

We choose the implementation around the product's requirements and your team's long-term maintainability. For the new Neologicx capability presentation, the engineering team should approve the exact current stack before publishing named frameworks and cloud platforms.

## Section CTA: Start with a Technical Discovery

### DESIGNER NOTE

Show dashboards, portals and institutional interfaces. Differentiate ‘web application’ from brochure website; route simple CMS work to the WordPress page.

### Implementation footer — not website-visible

| <b>Migration / launch</b>  | KEEP URL. Reposition from generic website design to custom web applications, portals and content platforms.                                                                     |
| <b>GSC — last 3 months</b> | /web-development-design-website/: 0 clicks • 49 impressions • avg position 15.84                                                                                                |
| <b>SEO title</b>           | Custom Web Application Development   Neologicx                                                                                                                                  |
| <b>Meta description</b>    | Custom web applications, portals, dashboards and content platforms designed for business workflows, institutions and digital products.                                          |
| <b>Sources / evidence</b>  | Portfolio PDF pp. 31–37; RAJUVAS/SKRAU/Jazz Café live case studies; prior audit; Search Console export 6 Aug 2026.                                                              |
| <b>Publish checks</b>      | Publish named technology logos only after engineering confirms current in-house capability. Proposed stack vocabulary should be reviewed at launch and periodically thereafter. |

## Mobile App Development for iOS, Android & Flutter

We design and build mobile applications for customer experiences, public services, communities and field workflows—with the backend, APIs and administration tools needed to make the app useful in real operations.

[Discuss Your Mobile App](#) • [View Mobile Case Studies](#)

### From the app screen to the system behind it

#### Customer & Community Apps

Registration, profiles, discovery, communication, transactions and engagement experiences.

#### Field & Operational Apps

Mobile workflows for teams that need to capture, retrieve or update business information away from a desk.

#### Connected Mobile Products

Apps integrated with web platforms, APIs, payments, notifications and administration dashboards.

#### App Evolution & Maintenance

Release updates, UX improvements, compatibility work and backend/integration changes as the product evolves.

### Selected mobile work

11. ECK–RTU Alumni Connect — alumni discovery, events, donations and notifications on Android and iOS.
12. Election Commission of India — a mobile service platform consolidating election information and citizen-facing utilities.
13. E- Parchi — a Red Cross Society pilot mobile initiative intended to improve access to private medical services for underserved users.
14. Heritage Olympiad — culture and heritage learning with quiz-based participation and leaderboards.

### A practical mobile delivery path

1. Define the mobile use case and what must work offline/online.

2. Map the backend, data, notifications, payments and external integrations.
3. Prototype critical journeys and validate them before full engineering.
4. Build, test on representative devices and prepare store/release assets.
5. Monitor, maintain and evolve the app after launch.

### Section CTA: Plan Your Mobile Product

#### DESIGNER NOTE

Use real mobile screens from 3–4 credible projects. Avoid a wall of platform logos. Pair each screenshot with the workflow it supports.

#### Implementation footer — not website-visible

|                            |                                                                                                                                                   |

| <b>Sources / evidence</b>  | Portfolio PDF pp. 16–26; ECI, E- Parchi, ECK Alumni, Culture Heritage and WUS live portfolio pages; Search Console export 6 Aug 2026.             |
| <b>Publish checks</b>      | Confirm whether native iOS/native Android are actively staffed versus Flutter-first delivery. Keep all App Store/Play Store links current.        |

## E-commerce Engineering for Growing Retail & D2C Businesses

A commerce site is only one part of the operation. We build and improve storefronts together with the product, payment, order, inventory and integration workflows that keep the business moving after checkout.

[Discuss Your Commerce Platform](#) • [View E-commerce Work](#)

### Commerce capabilities

#### Storefront Development

Responsive catalogs, product discovery, cart and checkout experiences aligned to your brand and buying journey.

#### Platform Engineering

Implementation and customization across Magento Open Source / Adobe Commerce, WooCommerce, Shopify and custom commerce when appropriate.

#### Payments & Integrations

Payment gateways and connections to order, inventory, CRM, messaging or other business systems.

#### Order & Inventory Workflows

Operational integration after the purchase so teams can manage fulfillment, stock, status and exceptions with less re-entry.

#### Modernization & Support

Platform upgrades, performance work, integration changes and staged improvements for existing commerce operations.

### Selected commerce experience

The portfolio includes enterprise and mid-market commerce work for food/FMCG and retail businesses, including BIKAJI, Bhikharam Chandmal, Panchranga Garments, Mota's Chips and God's Treat. Present these as evidence of delivered work—not as performance guarantees.

### Beyond the browser

Commerce can also move into conversational channels. Our portfolio includes WhatsApp-based ordering, support and complaint workflows that connect customer conversations to business systems.

## Section CTA: Explore WhatsApp Integration & Automation

### DESIGNER NOTE

Lead with commerce architecture and operations, then platforms. Use real storefront/client imagery for Bikaji/Bhikharam/Panchranga/Mota's/God's Treat where permission is current.

### Implementation footer — not website-visible

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Sources / evidence</b>  | Portfolio PDF pp. 38–39; Bikaji live case study; current E-commerce/Magento pages; prior audit; Search Console export 6 Aug 2026.                                                                                                                                                                                                                                                                                                     |
| <b>Publish checks</b>      | Use 'Adobe Commerce' and 'Magento Open Source' accurately. Confirm current platform certifications/versions before claiming them. Do not promise guaranteed sales or security.                                                                                                                                                                                                                                                        |

## API Development, Systems Integration & Automation

Connect the systems your business already depends on. We design APIs and integration workflows that move data and actions between applications, reduce duplicate manual work and make new digital products possible.

[Discuss an Integration](#) • [Explore WhatsApp Automation](#)

### Integration work we can support

#### API Design & Development

Application interfaces for web, mobile, partner and internal systems with clear data contracts and access rules.

#### Third-party Integrations

Connect payments, messaging, email, vendor, logistics and platform services to the workflows that need them.

#### Data Synchronization

Move and reconcile information between systems where teams currently depend on exports, re-entry or manual status updates.

#### Webhooks & Event-driven Workflows

Trigger downstream actions when orders, payments, messages or operational states change.

#### Integration Testing & Support

Validate failure paths, retries, permissions and real production edge cases—not only the happy-path API call.

### Examples from our work

Our portfolio includes engineering/consultancy workflows connected with vendors, logistics and email, as well as WhatsApp ordering, payment and customer-support flows. These are the kinds of cross-system problems where integration becomes part of the product experience rather than a back-office detail.

**Section CTA: Map Your Systems**

## DESIGNER NOTE

Use a simple system-integration diagram: apps ↔ API/integration layer ↔ payments/messaging/business systems.  
Keep code snippets secondary.

## Implementation footer — not website-visible

## WhatsApp Business Platform Integration & Automation

Turn WhatsApp from a standalone inbox into part of the business workflow. We connect customer conversations with ordering, support, notifications, payments and internal systems so the channel can do useful operational work.

[Discuss a WhatsApp Workflow](#) • [Explore Integration Services](#)

### Use cases

#### Customer Support

Structure inquiries and complaint workflows, route information to the right team and send relevant status updates.

#### Ordering & Commerce

Support conversational product/order flows and connect them to payments or commerce operations where appropriate.

#### Transactional Notifications

Send approved workflow notifications triggered by events in your application or business system.

#### System-connected Conversations

Link WhatsApp interactions to CRM, order, complaint or administration workflows instead of managing them as isolated chats.

#### Rule-based or AI-assisted Flows

Use deterministic flows where rules matter and AI assistance only where the use case, data and guardrails justify it.

### Evidence from the portfolio

6. BIKAJI complaint management — WhatsApp notifications connected to a structured customer-care workflow.
7. WhatsApp commerce concept — ordering, payment and complaint/support journeys through a conversational interface.
8. Health-worker support chatbot — AI-assisted learning/support concept with explicit guardrails; publish as a separate proof story only after domain/compliance review.

## Section CTA: Design the Conversation and the Workflow

### DESIGNER NOTE

Show a conversation beside the connected workflow (order/support/CRM), not a floating chatbot icon. Include clear 'human handoff' where the actual solution supports it.

### Implementation footer — not website-visible

## SaaS Product Development & Modernization

Build a SaaS product around the users, roles, workflows and commercial model it actually needs—from an early release through ongoing product evolution.

[Discuss Your SaaS Product](#) • [Explore Product Engineering](#)

### SaaS capabilities

#### Product & Workflow Definition

Clarify user roles, core jobs, permissions, plan boundaries and the workflows that create value.

#### Platform Architecture

Choose data, tenancy and application patterns that fit the product's current stage and expected growth.

#### Billing & Third-party Integrations

Connect subscription/payment services and the external tools the product requires.

#### Administration & Reporting

Give operators the visibility and controls needed to manage users, configuration, exceptions and product activity.

#### Modernization

Improve older SaaS applications through staged architecture, UX, performance and maintainability work.

### Start with the product model

The right SaaS architecture depends on more than expected traffic. Tenant boundaries, permissions, data isolation, billing, integrations, onboarding and support workflows should be understood before engineering decisions harden.

**Section CTA: Plan Your SaaS Architecture**

#### DESIGNER NOTE

Use platform layers and product workflows, not cloud-stock imagery. Link clearly back to Product Engineering and forward to MVP Development.

**Implementation footer — not website-visible**

| <b>Sources / evidence</b>  | Prior audit; portfolio PDF multi-stakeholder platform examples; current SaaS page; Search Console export 6 Aug 2026.                                                                 |
| <b>Publish checks</b>      | Confirm current cloud/DevOps practices. Use ‘multi-tenant’ only where the proposed architecture actually is multi-tenant. Confirm any compliance/security claims project by project. |

## MVP Development for Startups & New Digital Products

An MVP should reduce uncertainty—not simply reduce the feature list. We help teams identify what the first release must prove, then design and build a focused product that can be tested with real users.

Scope Your MVP • Explore Product Engineering

### A useful MVP answers a question

Before estimating screens, we define the customer problem, target user, critical journey and the assumptions that create the most risk. That gives the first release a job: validate a behavior, workflow or commercial premise that matters to the product roadmap.

### Our MVP path

1. Discovery — users, problem, assumptions and constraints.
2. Scope — must-have journeys, data, integrations and acceptance criteria.
3. Prototype — validate important interaction choices before engineering.
4. Build — deliver the smallest coherent release that can test the product premise.
5. Release & learn — collect feedback and convert what you learn into the next roadmap decision.

### Think beyond version one

We make deliberate trade-offs in an MVP, but we also identify which shortcuts are temporary and which architectural decisions will be expensive to reverse. That makes the next phase a planned evolution rather than an emergency rewrite.

**Section CTA: Discuss Your Product Idea**

#### DESIGNER NOTE

Show a scope funnel from problem → must learn → MVP → evidence → roadmap. Avoid rocket/startup clichés.

**Implementation footer — not website-visible**

| <b>Migration / launch</b>  | KEEP URL as a Product Engineering child page. Rewrite to emphasize learning, scope discipline and a credible path beyond version one.                                    |
| <b>GSC — last 3 months</b> | /mvp-development-startup/: 0 clicks • 9 impressions • avg position 52.78                                                                                                 |
| <b>SEO title</b>           | MVP Development for Startups & New Products   Neologicx                                                                                                                  |
| <b>Meta description</b>    | Define, design and build a focused MVP that tests the core product value and creates a practical foundation for the next release.                                        |
| <b>Sources / evidence</b>  | Prior audit; current MVP page; portfolio PDF product/platform examples; Search Console export 6 Aug 2026.                                                                |
| <b>Publish checks</b>      | Do not promise a fixed ‘fast’ timeline or minimal cost without scope. Confirm whether discovery/prototyping is separately billable before publishing commercial details. |

## Custom CRM & Sales Workflow Automation

When a standard CRM creates workarounds instead of adoption, a tailored system can align customer information, tasks, pipeline stages and service workflows with the way your team actually sells and supports.

[Map Your CRM Workflow](#) • [Explore Custom Software](#)

### Build around the customer lifecycle

#### Lead & Inquiry Management

Capture, assign, qualify and follow up on inquiries with clear ownership and status.

#### Accounts & Contacts

Centralize customer context, activities, documents and the information teams need at the point of work.

#### Pipeline & Tasks

Model stages, actions, reminders, approvals and exceptions around your actual sales process.

#### Service & Complaint Workflows

Connect post-sale support and complaint status to a structured customer record where the use case requires it.

#### Reporting & Integrations

Create operational views and connect the CRM with messaging, payments, ERP or other business applications.

### Custom does not have to mean complicated

The goal is not to reproduce every feature in a large commercial CRM. It is to identify the workflows that matter, remove unnecessary steps and give teams a system they can understand and maintain.

**Section CTA: Discuss Your Current CRM Gaps**

#### DESIGNER NOTE

Use a workflow/pipeline diagram and a clean admin dashboard example. Show integration points rather than generic salespeople photography.

**Implementation footer — not website-visible**

| <b>Meta description</b>    | Custom CRM software for lead, account, pipeline, task, customer-service and reporting workflows that need to fit your business process.                                          |
| <b>Sources / evidence</b>  | Prior audit; current CRM page; portfolio customer-care/workflow evidence; Search Console export 6 Aug 2026.                                                                      |
| <b>Publish checks</b>      | Only list marketing automation, telephony, WhatsApp or ERP integrations that the team can implement for the specific project. Avoid 'AI CRM' claims without a delivered example. |

## Custom Business Software & ERP Development

Bring disconnected operational processes into software designed around your roles, approvals and information flow—from inventory and production to projects, documents, workforce workflows and reporting.

[Discuss Your Operations](#) • [View Business Software Examples](#)

### Typical workflow areas

#### Operations & Production

Production tracking, operational status, resource movement and process visibility matched to the business.

#### Inventory, Procurement & Vendors

Purchasing, materials, stock, vendor activity and approvals connected to downstream work.

#### Projects & Documentation

Planning, milestones, documents, shipping/logistics and cross-department status for project-driven organizations.

#### Billing & Financial Workflows

Operational billing, expenses, collections or approvals where they form part of the solution scope.

#### Workforce & HR Workflows

Attendance, leave, performance or workforce administration where a business system needs these functions.

#### Dashboards & Reporting

Role-specific operational visibility, status, exceptions and reports built from the shared workflow data.

### Portfolio examples

6. Manufacturing — mobile milk collection plus inventory, billing and production tracking.
7. Engineering & consultancy — project planning, procurement, documentation, shipping, role-based approvals and status visibility.
8. Institute operations — inquiry, counseling, tutor pool, scheduling, enrollment and attendance.

9. Legal case management — case records, cause-list workflows, client/team coordination and daily updates.
10. Club management — member services, facilities, bookings, usage charges and monthly billing.

## Replace spreadsheets in stages

Business software succeeds when the rollout respects the people and processes already doing the work. We can prioritize the highest-friction workflow first, integrate what must remain, and expand the system as adoption and requirements become clearer.

### Section CTA: Map Your Business Workflow

#### DESIGNER NOTE

Use operational modules around a shared data core. Feature manufacturing and engineering/consultancy proof prominently; these are stronger than a generic ERP icon grid.

## Implementation footer — not website-visible

|                            |                                                                                                                                                                                                                                                                                                                                                                               |

## WordPress & WooCommerce Development

For content-led websites and WooCommerce stores, WordPress can be a practical, maintainable choice when the information architecture, content model, performance and update process are designed properly from the start.

[Discuss Your WordPress Project](#) • [Explore Web Applications](#)

### WordPress work

#### Custom Content Websites

Information architecture, reusable page components and content models aligned to how editors actually publish.

#### Institutional Platforms

Structured public websites for organizations with departments, programs, notices and large content sets.

#### WooCommerce

Product catalogs, checkout, payments and extensions/integrations for suitable commerce use cases.

#### Migration & Redesign

Move or restructure an existing site while protecting useful content, URLs and search equity.

#### Maintenance & Improvement

Planned updates, compatibility work, performance improvements and content/system enhancements.

### When WordPress is not the right answer

If the requirement is primarily a workflow-heavy product, complex operational system or deeply integrated application, we will recommend a custom web application instead of forcing the project into a CMS.

**Section CTA: Choose the Right Web Approach**

#### DESIGNER NOTE

Position WordPress as the right tool for content/CMS needs—not as the company's identity. Feature RAJUVAS and Rajasthan Kabir Yatra as concrete examples.

**Implementation footer — not website-visible**

## Construction Site Operations & Project Control Software

Give owners and supervisors a shared operational view across multiple construction sites—covering materials, workforce records, daily expenses and vendor payments without relying on disconnected registers and spreadsheets.

[Request a Walkthrough](#) • [Discuss Your Workflow](#)

### Built around daily site operations

#### Multi-site Visibility

View project/site activity from a centralized administration layer while supervisors work with their assigned site data.

#### Materials

Record and review material supplied, procured or used across sites so operational teams have a consistent trail.

#### Workforce Records

Manage attendance and related workforce information such as salary/leave workflows where configured.

#### Petty Expenses

Capture routine site expenses by category instead of reconstructing them later from cash notes and messages.

#### Vendors & Payments

Track vendor/subcontractor payment information and project-level expenses in the same operational context.

### Configure it around your project controls

Construction businesses differ in cost heads, approval rules, reporting and responsibility across sites. The implementation begins by mapping your current registers and approvals, then configuring the system around the controls that matter to management and site teams.

**Section CTA: See Whether the Solution Fits**

## DESIGNER NOTE

Show the actual supervisor/admin flows: site selector, workforce/material entry, expense/vendor view. Use a product walkthrough CTA rather than generic 'contact us'.

## Implementation footer — not website-visible

| <b>Sources / evidence</b>  | Portfolio PDF p. 19; current Construction Software page; prior audit; Search Console export 6 Aug 2026.                                                                                      |
| <b>Publish checks</b>      | Confirm the currently supported feature set, mobile platforms, multi-language support and demo availability. Do not add scheduling/GPS/BIM claims unless the product actually supports them. |

## Complaint Management Software for Structured Customer Service

Move complaints out of scattered calls, messages and spreadsheets into a workflow where each issue can be captured, categorized, prioritized, assigned, tracked and communicated to the customer.

[Request a Walkthrough](#) • [Discuss Your Complaint Workflow](#)

### A clear path from complaint to resolution

#### Complaint Capture

Create a structured record with the information your team needs to understand and act on the issue.

#### Category & Severity

Classify complaints so teams can prioritize, route and report on recurring types of problems.

#### Ownership & Status

Track who is responsible, what stage the complaint has reached and where follow-up is required.

#### Customer Notifications

Keep customers informed through configured notification channels, including WhatsApp workflows where implemented and approved.

#### Administration & Reporting

Use dashboards to review complaint status, categories, patterns and unresolved work.

### Proven in an FMCG customer-care context

The portfolio includes a complaint-management portal for BIKAJI in which customers could raise complaints, administrators could categorize and track severity/status, and WhatsApp notifications were used to keep the customer informed.

**Section CTA: View the BIKAJI Case Study**

#### DESIGNER NOTE

Use a ticket lifecycle visual and actual admin dashboard screens. Make 'severity/category/status/notification' the proof, not AI imagery.

## Distributor–Retailer Order Management System

Centralize the order lifecycle between distributors and retailers so teams can see orders, stock context, fulfillment status and exceptions without coordinating everything through calls, spreadsheets and disconnected messages.

[Request a Product Demo](#) • [Discuss Your Order Flow](#)

### Bring the order lifecycle into one workflow

#### Order Processing

Capture and manage orders through clear states from placement through fulfillment and delivery.

#### Inventory Visibility

Connect stock information to order decisions and surface low-stock conditions where configured.

#### Fulfillment & Dispatch

Track processing and shipping status so internal teams and trading partners share the same operational view.

#### Returns

Manage return requests through a defined status workflow where the business process requires it.

#### Connected Systems

Integrate e-commerce, CRM, accounting or other systems when they need to exchange order/customer information.

#### Reporting

Review order volume, status and exceptions through role-appropriate operational reports.

### Fit the system to your channel model

Distributor, dealer and retailer networks differ in pricing, territories, approvals and fulfillment rules. We begin by mapping those rules so the configured product reflects the way orders actually move through your business.

**Section CTA: Map Your Order Workflow**

## DESIGNER NOTE

Show lifecycle: retailer order → distributor review → inventory/fulfillment → dispatch → status/return. Use actual product UI and a demo CTA.

## Implementation footer — not website-visible

|                            |                                                                                                                                                                                                          |

## School Management System for Connected Administration

Bring student administration, attendance, academic information, communication and parent/teacher workflows into one configurable platform designed around the way your institution operates.

[Request a Walkthrough](#) • [Discuss Your Institution](#)

### Core workflow areas

#### Admissions & Student Records

Manage application/admission information, documents and centralized student records.

#### Attendance

Record and report attendance through configured digital workflows and keep relevant stakeholders informed.

#### Academic Progress

Manage grades/results and share appropriate progress information with students and parents.

#### Teacher & Timetable Workflows

Support classes, scheduling and teacher-facing administration where included in scope.

#### Fees & Communication

Connect fee status and institutional notifications where payment/communication functions are configured.

#### Parent Access

Provide parents with appropriate visibility into attendance, progress, fees and announcements.

### Education experience beyond one product

Neologicx's portfolio also includes institute operations, university websites and portals, alumni engagement, online assessment/heritage learning and public-sector education workflows. That experience can inform configuration without assuming every institution follows the same process.

**Section CTA: Review the Education Portfolio**

## DESIGNER NOTE

Clearly badge this as a configurable education solution. Use role tabs for administrator / teacher / parent rather than an overlong feature list.

## Implementation footer — not website-visible

## Customer Care & Digital Commerce for BIKAJI

A connected set of digital experiences spanning e-commerce, mobile commerce and a structured customer-care workflow for an established FMCG brand.

[Discuss a Similar Workflow](#) • [Explore Complaint Management](#)

### The context

BIKAJI needed digital customer experiences that went beyond a storefront. Commerce, mobile access and post-purchase/customer-care interactions created multiple workflows that had to be managed coherently.

### The customer-care workflow

Neologicx developed a complaint-management portal designed to give customers a structured way to raise issues and give the internal team a clearer process for review and follow-up.

11. Complaint capture through a structured digital workflow
12. Categorization and severity tracking for administration teams
13. Dashboard visibility into complaint status and handling
14. WhatsApp notifications used to keep customers informed through the process

### Commerce scope

The wider engagement also included e-commerce and mobile-commerce work. On the new site, show only the components/screens that are still factually attributable to Neologicx and approved for public use.

### What this project demonstrates

The project is useful proof of Neologicx's ability to connect customer-facing experiences with the operational systems behind them—commerce, customer service, workflow status and messaging rather than a standalone front end.

**Section CTA: Talk About Your Customer Workflow**

## DESIGNER NOTE

Use one hero product/dashboard image plus a complaint lifecycle graphic. Put 'E-commerce • Customer Care • WhatsApp' as small capability tags.

## Implementation footer — not website-visible

| <b>Publish checks</b>      | Confirm current permission to use BIKAJI name/logo/screens. Verify which commerce components remain accurate. Do not carry over unsubstantiated traffic/conversion claims or future-ML wording. |

## Alumni Engagement App for ECK–RTU

A mobile platform designed to help alumni join the community, discover one another, stay informed about events and support alumni initiatives.

[Discuss a Community App](#) • [Explore Mobile Development](#)

### The challenge

Alumni communities span graduating years, cities and industries. Useful engagement requires more than an announcement feed: members need a way to identify one another, while administrators need tools to coordinate communication and activities.

### The solution

15. Alumni registration and authenticated access
16. Search/discovery by batch, city or industry
17. Push notifications for important updates
18. Event management and communication
19. Donation-drive support
20. Mobile delivery for Android and iOS

### What this project demonstrates

The project combines community discovery, administration, notifications and transaction-oriented activity in one mobile experience—useful proof for associations, membership organizations, universities and professional communities.

**Section CTA: Plan Your Member Experience**

#### DESIGNER NOTE

Phone UI carousel with four labelled journeys: Join • Discover alumni • Events • Give/Donate. Show Android/iOS badges only if live links work.

**Implementation footer — not website-visible**

|                            |                                                                                                                                    |

| <b>Earlier reference</b>   | <a href="https://neologicx.com/portfolio/eck-alumni-connect/">https://neologicx.com/portfolio/eck-alumni-connect/</a>              |
| <b>Migration / launch</b>  | KEEP URL. Feature as a current-looking mobile/community case study and preserve Android/iOS store links if they remain active.     |
| <b>GSC — last 3 months</b> | /portfolio/eck-alumni-connect/: 0 clicks • 13 impressions • avg position 6.38                                                      |
| <b>SEO title</b>           | ECK–RTU Alumni Connect Mobile App Case Study   Neologicx                                                                           |
| <b>Meta description</b>    | An Android and iOS alumni engagement app supporting discovery, events, donations and push notifications for the ECK–RTU community. |
| <b>Sources / evidence</b>  | Portfolio PDF p. 22; live ECK Alumni Connect portfolio page; Search Console export 6 Aug 2026.                                     |
| <b>Publish checks</b>      | Test both app-store links at launch; confirm ECK–RTU naming/logo permission and whether donation/event functions remain current.   |

## E- Parchi: Mobile Access to Medical Services

An Android initiative developed as a Red Cross Society pilot, intended to help underserved users access medical services from private doctors through a mobile channel.

[Discuss a Public-Service App](#) • [Explore Mobile Development](#)

### Project context

The E- Parchi project focused on a specific access problem: using mobile technology to make a medical-service initiative easier to reach for people who might otherwise face barriers to private care.

### Neologicx's role

Neologicx developed the Android application for the Red Cross Society pilot project. The project was publicly inaugurated at an International Red Cross Society function in Chandigarh, according to the existing Neologicx project record.

### What this project demonstrates

E- Parchi is best presented as evidence of mobile product delivery in a public/social-impact context. The new case study should stay factual and compact unless the client can provide validated usage or outcome data.

**Section CTA: Talk About Your Mobile Use Case**

### DESIGNER NOTE

Keep the recognizable E- Parchi project identity for search continuity. Use a short factual story; do not pad the page with generic healthcare/AI copy.

## Implementation footer — not website-visible

|                            |                                                                                                                                                                                                                              |

| <b>Meta description</b>    | E- Parchi is an Android mobile initiative developed as a Red Cross Society pilot to help underserved users access private medical services.                                                                                  |
| <b>Sources / evidence</b>  | Live E- Parchi portfolio page; Search Console export 6 Aug 2026. The supplied portfolio PDF does not provide a separate E- Parchi slide.                                                                                     |
| <b>Publish checks</b>      | Verify current Red Cross naming/permission and the exact official event wording. Remove the old ‘under consideration for PAN India implementation’ statement unless there is current evidence. Avoid medical outcome claims. |

## University Web Platform for RAJUVAS

A responsive WordPress website designed to make a large public university's academic and institutional information easier to organize, publish and access across devices.

[Discuss an Institutional Website](#) • [Explore Web Development](#)

### The challenge

Public university websites serve many audiences and large volumes of changing information—students, faculty, administrators, programs, notices and institutional content. The platform has to make that complexity navigable without making publishing harder for the organization.

### The solution

21. Responsive experience across desktop and mobile
22. Structured presentation of courses, departments and institutional information
23. WordPress-based content management for maintainable publishing
24. Information architecture designed for students, faculty and administrative audiences

### What this project demonstrates

RAJUVAS is strong evidence for content-rich institutional web work: the engineering task is not merely visual redesign, but organizing a large information environment so that publishing and discovery can coexist.

**Section CTA: Plan Your Institutional Platform**

### DESIGNER NOTE

Show desktop/mobile views plus an information-architecture snapshot. Make the content-management challenge visible rather than calling it simply a 'website'.

**Implementation footer — not website-visible**

|                            |                                                                                                                                                                               |

| <b>Meta description</b>    | A responsive WordPress web platform for Rajasthan University of Veterinary & Animal Sciences, designed for complex institutional content and stakeholders.                    |
| <b>Sources / evidence</b>  | Portfolio PDF p. 32; live RAJUVAS portfolio page; Search Console export 6 Aug 2026.                                                                                           |
| <b>Publish checks</b>      | Confirm the university's current name/accreditation wording and permission to show screens/logo. Avoid claiming administrative modules that are not part of this web project. |

## Website & CMS Modernization for SKRAU

A redesigned public website and backend content-management experience for Swami Keshwanand Rajasthan Agricultural University, built around the demands of a large academic institution.

[Discuss a University Platform](#) • [Explore Web Development](#)

### The challenge

A university website must serve fast-changing public information while reflecting a complex organization of programs, departments, notices and academic administration. The backend matters as much as the public interface because institutional teams need a dependable way to keep information current.

### The delivered direction

Neologicx revamped the website and backend/CMS environment. The existing project record describes support for institutional information and administration workflows including instructions, examinations and degree-related information.

### What this project demonstrates

Together with RAJUVAS, this project demonstrates repeat experience in large public-university web environments where content structure, publishing control and stakeholder usability matter more than visual novelty.

**Section CTA: Modernize Your Institutional Website**

#### DESIGNER NOTE

Pair public-site screens with a small CMS/content workflow diagram. Do not use the same layout/image sequence as RAJUVAS; make the backend/CMS angle distinct.

## Mobile Service Platform for the Election Commission of India

A mobile application designed to bring multiple election-information and citizen-service functions into one accessible experience for different stakeholders.

Discuss a Public-Service Platform • Explore Mobile Development

### The context

Election information serves citizens, candidates, political stakeholders and media, often across different services and data sources. The application concept was to consolidate useful public-facing functions into a single mobile experience.

### Functions described in the project record

- 25. Candidate search and affidavit information
- 26. Past election data, trends and results
- 27. Digital voter-slip functionality
- 28. Polling-booth location support
- 29. Complaint submission

### What this project demonstrates

The project is strong evidence of Neologicx's experience designing mobile workflows for a complex public-information environment with multiple stakeholder needs.

**Section CTA: Talk About Your Public-Facing App**

#### DESIGNER NOTE

Use factual government-project presentation—no patriotic stock imagery, no implied endorsement. Show service categories and interface evidence.

## Implementation footer — not website-visible

## Heritage Olympiad Mobile Learning Experience

A mobile quiz and learning experience created for Heritage Olympiad, focused on helping young participants engage with India's tangible, intangible and natural heritage.

[Discuss a Learning Experience](#) • [Explore Mobile Development](#)

### The idea

Heritage Olympiad was created to make culture and heritage education more participatory. The mobile experience needed to translate a broad subject into an accessible learning and competition format.

### The experience

- 30. Content spanning tangible, intangible and natural heritage
- 31. Quiz-based learning and participation
- 32. Single-player and multiplayer modes described in the portfolio
- 33. Leaderboards to support competition and engagement

### What this project demonstrates

This is a better proof point for education/quiz capability than a generic 'online quiz software' product page because it shows a real audience, subject and engagement model.

**Section CTA: Design a Learning Product**

#### DESIGNER NOTE

Use cultural content/app screens and the three heritage categories. Avoid presenting it as a generic quiz template.

## Implementation footer — not website-visible

|                            |                                                                                                                                                                                                                                                    |

| <b>Meta description</b>    | A mobile culture and heritage learning experience covering tangible, intangible and natural heritage with quiz-based participation and leaderboards.                                                                                               |
| <b>Sources / evidence</b>  | Portfolio PDF p. 17; live Culture Heritage portfolio page; Search Console export 6 Aug 2026.                                                                                                                                                       |
| <b>Publish checks</b>      | Confirm Cultre naming/logo permission, app availability and exact Olympiad status. Do not imply IIT Kanpur sponsorship/partnership from presentation imagery unless documented.                                                                    |

## Restaurant & Event Management Platform for The Jazz Café, UK

A web-based system designed to bring restaurant bookings and event operations into a more coordinated back-office workflow for The Jazz Café in Reading, UK.

[Discuss an Operations Platform](#) • [Explore Custom Software](#)

### The challenge

Restaurant reservations and event operations create overlapping workflows across bookings, menu choices, payments, reminders and different event formats. The goal was to unify those back-office activities instead of managing them as disconnected processes.

### The solution scope

- 34. Restaurant booking management
- 35. Menu selection and payment-related workflows
- 36. Event hosting with partial-payment booking
- 37. Notifications and periodic reminders
- 38. Support for private parties, corporate events and festival/event formats

### What this project demonstrates

The Jazz Café is valuable global-facing proof because it shows Neologicx working on a business operations platform for a UK client, not simply delivering a marketing website.

**Section CTA: Modernize Your Booking or Event Workflow**

#### DESIGNER NOTE

This should visibly signal international delivery. Combine real venue/event imagery with product screens for reservations and events.

## Implementation footer — not website-visible

| <b>Migration / launch</b>  | KEEP URL and feature prominently as international proof. Rewrite as a restaurant/event operations platform story.                                        |
| <b>GSC — last 3 months</b> | New page / no matching historical URL in the supplied 3-month export.                                                                                    |
| <b>SEO title</b>           | The Jazz Café UK — Restaurant & Event Platform Case Study   Neologicx                                                                                    |
| <b>Meta description</b>    | Restaurant and event-management software for The Jazz Café in Reading, UK, covering bookings, event workflows, payments and reminders.                   |
| <b>Sources / evidence</b>  | Portfolio PDF p. 33; live Jazz Café portfolio page.                                                                                                      |
| <b>Publish checks</b>      | Confirm current client naming/logo permission and whether the system remains in use. Do not imply the London venue; the portfolio specifies Reading, UK. |

## Worker Community Mobile App for WUS

A mobile community project developed for WUS / Worker Union Support to support digital connection and inclusion for workers through a unified platform.

[Discuss a Workforce App](#) • [Explore Mobile Development](#)

### Project context

The existing Neologicx project record describes WUS / Worker Union Support as a worker–trade-union digital community intended to support digital and financial inclusion and help workers address personal and professional needs.

### What to show on the new site

Use verified screenshots and a concise description of Neologicx’s development role. Expand this story only after the team can document specific app workflows and outcomes.

**Section CTA: Talk About Your Community Platform**

### DESIGNER NOTE

Keep this page short until better screenshots/project facts are supplied. A concise legitimate case study is stronger than invented detail.

## Implementation footer — not website-visible

## Pre-Launch Content & Design Sign-off

Before the new website is made public, one owner should sign off each of these categories.

### Claims & proof

- 39. Verify all client names, logos, screenshots and case-study facts; obtain permission where required.
- 40. Resolve conflicting client/project statistics. Publish one verified set or omit counters entirely.
- 41. Remove future/experimental features from current capability language unless they are now delivered and demonstrable.
- 42. Do not use 'best', 'leading', 'bug-free', '100% secure', 'guaranteed' or similar claims without defensible evidence.

### Delivery & commercial

- 43. Confirm engagement models, minimum commitments, time-zone overlap, NDA/IP process, source-code ownership and handover practices.
- 44. Confirm the public sales email, phone/WhatsApp numbers, calendar URL and response-time promise.
- 45. Confirm post-launch support/maintenance wording and any SLA commitments.

### Technology

- 46. Engineering approves every technology logo/name shown publicly and removes stacks that are no longer actively supported.
- 47. Next.js build passes server-rendering, canonical, sitemap, robots, structured-data, performance and accessibility checks.
- 48. App-store, product-demo, social and external links are tested and current.

### SEO migration

- 49. Every retained URL is present in the new route inventory and every merge/retire decision has a tested status code.
- 50. Legacy /home/contact/, service, portfolio and product paths redirect directly to their canonical successors.
- 51. The indexed portfolio PDF remains accessible at the same URL.
- 52. Search Console and analytics verification work in production; staging noindex/blocking rules are removed deliberately at launch.

## Legal & privacy

53. Publish reviewed Privacy Policy, Terms and Cookie Policy pages; do not copy generic legal text from another company.
54. Contact forms collect only necessary information, explain consent/processing appropriately and route submissions securely.

## Source Register

55. Neologicx Enterprise Solutions Portfolio (attached PDF, 40 pages; reviewed page by page).
56. Neologicx Global Market Website Content Audit (earlier team-ready report; decisions reconciled into this master).
57. Google Search Console export: neologicx.com-Performance-on-Search-2026-08-06.xlsx — Search type Web, last 3 months.
58. Neologicx live website and selected portfolio/service/product pages, checked 6 August 2026 for factual/reference continuity.
59. Prior terminology validation: WhatsApp Business Platform and current Adobe Commerce / Magento naming.
